# Where does the giant squid live?

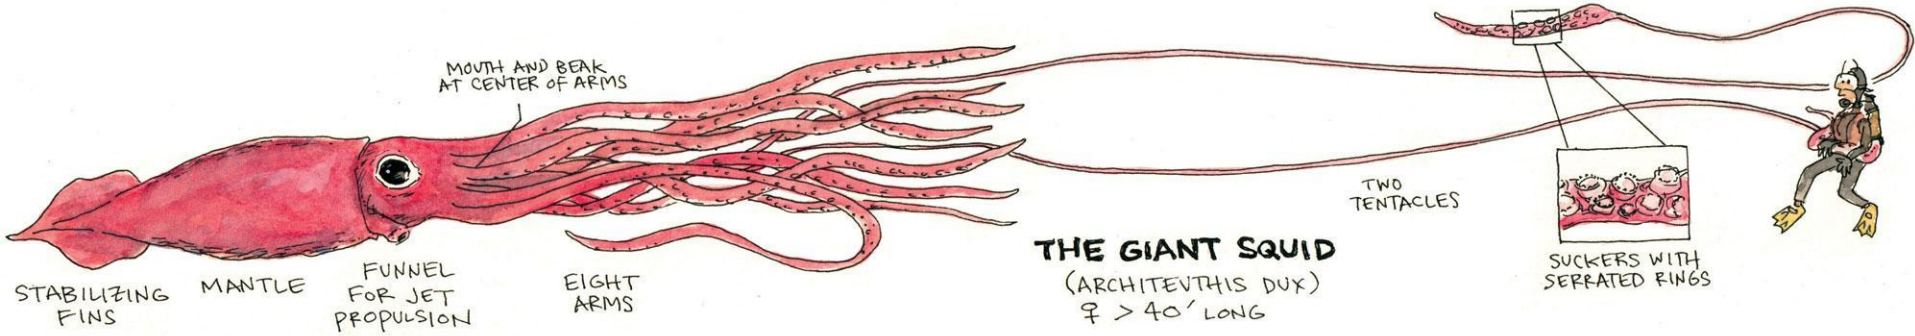

Giant squid live in the Twilight Zone.

This is between 1000 and 2000 feet deep in the ocean. The Twilight Zone can be found in any ocean.

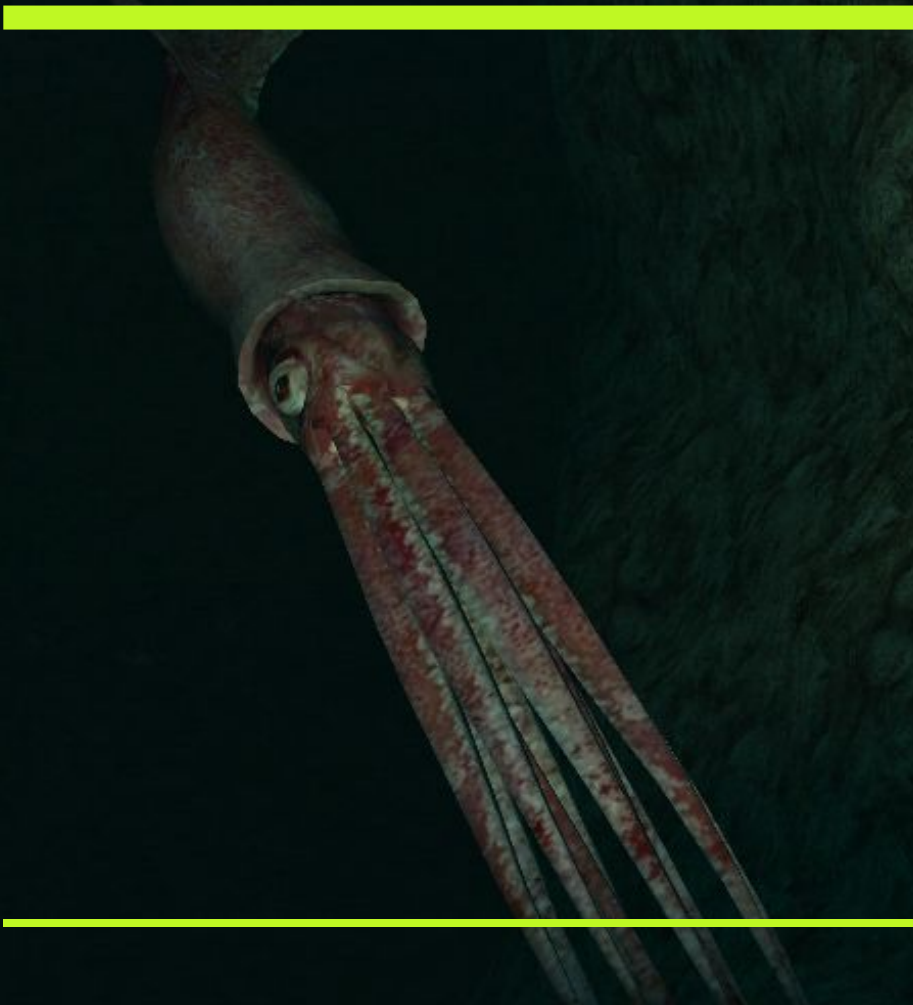

Twilight Zone

# Giant Squid Anatomy

The squid has giant tentacles and two tiny eyes. They are the size of a fire bee. Its body is a forty three foot oval. The body covering is sheath. It is a really dark red and sometimes white color. The beak makes it an oval shape.

## Giant Squid Facts:

- Baby giant squid can glow in the dark.

### Giant Squid

The giant squid is an amazing ocean animal for many reasons. First, it has a small eye for how big it is. Second, when it is a baby it looks like it glows. However, it is invisible to us. It is visible to the baby squid. It needs a light to see when it is a baby. If it doesn't light up, it might be killed before it reaches adulthood. This is very young to humans, but very old to giant squids.

The giant squid eats anything. For example, it can find small whales and eat it. It can also find a lantern fish depending on the size. The giant squid also likes to eat other squid. This is very interesting. It eats its food by using its tentacles and beak because this is how it grabs stuff and pulls it in. It has spikes on his tentacles.

The squid has giant tentacles and two tiny eyes. They are the size of a fire bee. Its body is a forty three foot oval. The body covering is sheath. It is a really dark red and sometimes white color. The beak makes it an oval shape.

The giant squid has many special features. First, these suckers leave ugly battle scars. Giant squid tentacles can regenerate. This is very cool because not all animals can regenerate. Also, they come to the surface at night because the higher the zone the more food. However,
