The Blue Glaucus
By Luke Evans Deher-Nelson

Introduction

The Blue Glaucus has a funny name but even though it means edible gray fish it is still very poisonous so don't eat it.

Its habitat is the sunlight zone which means you could be poisoned if your not

careful.

Diet and predators

It eats porchagese man o'war and other poisonous animals so it can protect itself.

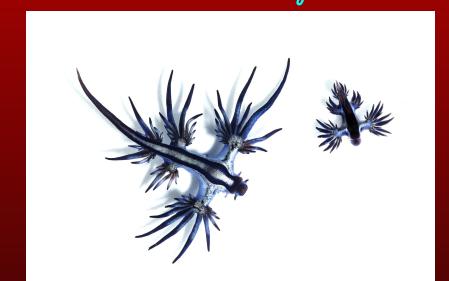

Its predators are pelicans, seagulls, and other sea birds. It is also endangered by

water pollution.

Interesting facts

- It will live in groups sometimes. It lets of a small discharge to stun its prey then it will kill it with a bigger discharge.
- The Blue Glaucus was discovered in 1777 which means it is 226 years old!
